

Empathy Map

Persona: Dr. Meera Rao — Cardiologist / Clinical Data Analyst

SAYS • "I don't have time to manually review every patient's full history." • "I need to know which factors matter most, not just raw numbers." • "Show me the risk clearly, not buried in a spreadsheet."	THINKS • Wonders if there's a pattern being missed across patients • Worries about diagnosing too late • Wants confidence that decisions are backed by data, not guesswork
DOES • Reviews patient charts and lab reports daily • Cross-checks symptoms against known risk factors manually • Consults dashboards/reports when available	FEELS • Pressured by high patient volume and limited time • Reassured when data supports a diagnosis • Frustrated by fragmented or unclear data

Pain Points

- Manually spotting risk patterns across many patient records is slow
- Existing data isn't visualized in a way that highlights key risk factors
- Difficult to explain findings to patients or non-technical stakeholders

Gains Sought

- A quick, visual summary of which factors most predict heart disease risk
- Confidence in flagging high-risk patients earlier
- A shareable report/dashboard for team and stakeholder discussions
