

Heart Disease Analysis

Phase 2: Requirement Analysis

Customer Journey Map

Naga Nandini Padidham | [GitHub: nandinipadidham-lgtm/Heart-Disease-Analysis](#)

Overview

This journey map traces how a stakeholder — a healthcare analyst, hospital administrator, or public health researcher — moves from first recognizing a need to acting on insights delivered by the Heart Disease Analysis dashboard.

Awareness	Data Access	Exploration	Insight & Decision	Action
Healthcare stakeholder recognizes the need to understand heart disease patterns in patient population.	Stakeholder is given access to the published Tableau Public dashboard link / embedded dashboard in the web app.	User applies filters (Gender, Smoking, Alcohol, Heart Disease) and browses KPI cards, charts, and the Tableau Story to explore risk factors.	User identifies high-risk groups (e.g. age 60-69, diabetics, smokers) from visualized insights and recommendations.	Organization acts on insights — targeted screening programs, awareness campaigns, lifestyle intervention outreach.

Stage Details

1. Awareness — The stakeholder recognizes a need to understand heart disease patterns across the patient population, often prompted by rising case numbers or a request for a data-driven health report.
2. Data Access — The stakeholder is given the published Tableau Public dashboard link, or accesses it through the embedded view inside the project's Flask web application.
3. Exploration — Using interactive filters (Gender, Heart Disease status, Smoking, Alcohol Drinking), the stakeholder explores KPI cards, charts, and progresses through the Tableau Story to understand risk factors in depth.
4. Insight & Decision — Patterns become clear: heart disease concentrates in ages 60-69, is elevated among diabetics, stroke patients, and smokers. The stakeholder forms a data-backed view of where risk is highest.
5. Action — Insights translate into real decisions: targeted screening programs for older adults, smoking cessation campaigns, and diabetes management outreach.
